

Ionut Bogdan Chelaru

Mobile Software Engineer — Android & iOS | JLPT N4

Padova, Italy · Open to relocation to Japan (visa sponsorship welcome)

ionutb.chelaru@gmail.com · +39 331 205 1502 · [linkedin.com/in/ionutbchelaru](https://www.linkedin.com/in/ionutbchelaru)

PROFESSIONAL SUMMARY

Mobile engineer with 6 years on native iOS (Swift/UIKit) and Android (Java/Kotlin), from consumer phones to custom embedded hardware. Comfortable across a whole app: UI, logic, local persistence, and REST APIs. Past Android-to-iOS ports cut crash reports by 40%+ and lifted the App Store rating. Also strong in the harder corners: Core Bluetooth and NFC, real-time SIP/VoIP, and performance tuning on resource-constrained devices. Studying Japanese (JLPT N4, ongoing) and seeking a bilingual engineering role in Japan.

LANGUAGES

Japanese — JLPT N4 (self-study, ongoing) · English — B2 · Italian — Native · Romanian — Native

TECHNICAL SKILLS

Languages: Swift, Java, Kotlin, JavaScript, TypeScript, SQL, Python

iOS: Swift, UIKit, Auto Layout, Core Bluetooth, Core NFC, GRDB/SQLite, Firebase, Xcode, Instruments, App Store distribution

Android: Android SDK, Room, Retrofit/OkHttp, Paho MQTT, Firebase (FCM, Crashlytics), Bluetooth/NFC, Android Studio, AOSP

Real-time / VoIP: SIP, FreeSWITCH, Linphone, SDP, RTP, MQTT, pcap/Wireshark analysis

Cross-platform & Web: React Native, Electron, React, Next.js

Tools & Practices: Git, REST APIs, CI/CD, Agile/Scrum, performance profiling, logcat analysis, code review, pair programming

PROFESSIONAL EXPERIENCE

Software Engineer — InfinitePlay S.r.l., Padova, Italy May 2020 – Present

IpDoor — SIP-based video doorbell, intercom, and access-control platform spanning iOS, Android, and desktop apps across consumer and custom embedded hardware.

iOS Development (Swift / UIKit)

- Led iOS development in Swift/UIKit and ported Android-only features over to iOS. The work cut crash reports by 40%+ and raised the App Store rating.
- Built UIKit screens and custom views with Auto Layout, including the navigation flow and view-state handling.
- Wired up REST APIs with async loading, JSON parsing, and proper error and empty states.
- Built the GRDB/SQLite persistence layer with transactional cross-table writes. Persisted in-flight state (UserDefaults/Codable) so it survived process kills, ending a class of data-loss and post-restart crashes.
- Added Core Bluetooth pairing and device provisioning.
- Owned App Store releases. Drove the rating up through steady bug-fixing and Instruments-guided performance work.

Android Development (Java / Kotlin)

- Built core Android features for consumer phones and custom Rockchip-based Android 11 devices using Room, Retrofit/OkHttp, Firebase (FCM, Crashlytics), and Paho MQTT.
- Built the UI with RecyclerView, custom views, and fragment navigation, laid out to fit both phones and embedded touchscreens.
- Handled app logic and local persistence with Room (transactional, batched writes) and SharedPreferences. Integrated REST APIs over Retrofit/OkHttp.
- Added Bluetooth and NFC features that opened up new markets, and trimmed memory use and load times on low-resource hardware.

Real-time Communication (SIP / VoIP)

- Built and debugged SIP/VoIP calling (Linphone) across Android, iOS, and Electron, routed through a FreeSWITCH back-to-back user agent.
- Tracked down call-transfer, hold, and media-negotiation bugs at the SIP/SDP signaling level with pcap/Wireshark.

Embedded & AOSP

- Customized AOSP (Android 11) for embedded devices: SELinux policy fixes, Bluetooth HAL debugging, and OTA and log-filtering improvements that increased reliability.

Cross-platform & Web

- Delivered React Native and Electron features for a desktop-focused multi-platform application.
- Built and maintained a Next.js/React frontend (TypeScript) with localization and cross-browser support.

Engineering Practices & Infrastructure

- Maintained a shared cross-platform SDK, and ran code reviews and pair-programming sessions to keep the architecture clean.
- Ran self-hosted Git infrastructure (bare repos, submodules, feature-branch and squash-merge flow). Built an S3-based diagnostic log-collection pipeline spanning Android, iOS, and Electron.

Machine Learning Intern — Synclab S.r.l., Padova, Italy Sep 2019 – Oct 2019

- Applied Python machine learning to medical documents: data preprocessing, model training, and evaluation.

PROJECTS & LEADERSHIP

Futsal Scorer — Standalone watchOS Scorekeeping App (Personal Project, 2025)

- A solo watchOS app built in SwiftUI for keeping score during futsal matches. Tracks goals per player and per team across two sides, with undo and editable rosters — all on the watch, no iPhone required. Covered with unit tests.

Xenuss Cup — Founder & Organizer (2019–2020)

- Founded and ran a nine-day esports tournament with 100+ players, handling logistics, scheduling, and player comms. Ran a follow-up event the next year.

EDUCATION

BSc in Computer Engineering — University of Padova, Italy (2020)
